# **Chapter 3 Markov Decision Process**

1 Markov Processes

2 Markov Reward Processes

3 Markov Decision Processes

### Introduction to MDPs

- Markov decision processes formally describe an environment for reinforcement learning
- Where the environment is *fully observable*
- i.e. The current *state* completely characterises the process
- Almost all RL problems can be formalised as MDPs, e.g.
  - Optimal control primarily deals with continuous MDPs
  - Partially observable problems can be converted into MDPs

### Markov Property

"The future is independent of the past given the present"

#### Definition

A state  $S_t$  is *Markov* if and only if

$$\mathbb{P}[S_{t+1} \mid S_t] = \mathbb{P}[S_{t+1} \mid S_1, ..., S_t]$$

- The state captures all relevant information from the history
- Once the state is known, the history may be thrown away
- i.e. The state is a sufficient statistic of the future

### State Transition Matrix

For a Markov state s and successor state s', the state transition probability is defined by

$$\mathcal{P}_{ss'} = \mathbb{P}\left[S_{t+1} = s' \mid S_t = s\right]$$

State transition matrix  $\mathcal{P}$  defines transition probabilities from all states s to all successor states s',

$$\mathcal{P} = \textit{from} egin{bmatrix} \textit{to} \\ \mathcal{P}_{11} & \dots & \mathcal{P}_{1n} \\ \vdots & & & \\ \mathcal{P}_{n1} & \dots & \mathcal{P}_{nn} \end{bmatrix}$$

where each row of the matrix sums to 1.

#### Markov Process

A Markov process is a memoryless random process, i.e. a sequence of random states  $S_1, S_2, ...$  with the Markov property.

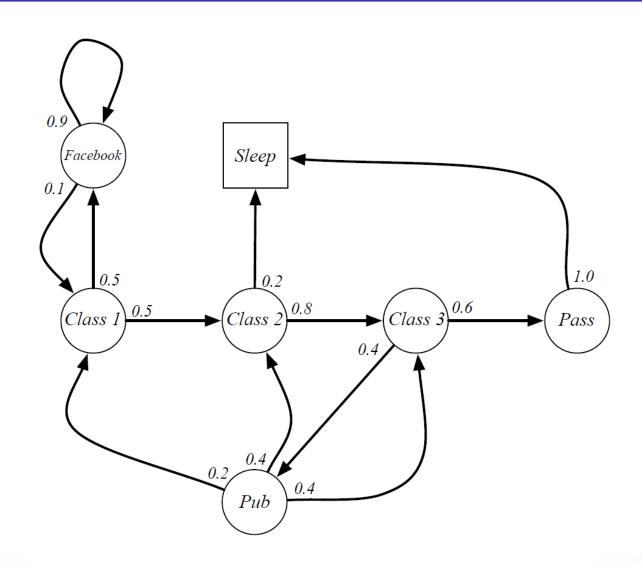

#### Definition

A Markov Process (or Markov Chain) is a tuple  $\langle \mathcal{S}, \mathcal{P} \rangle$ 

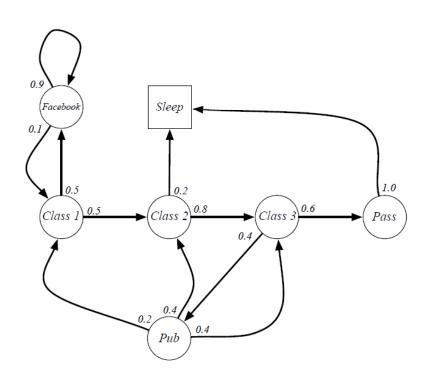

- $lue{\mathcal{S}}$  is a (finite) set of states
- lacksquare is a state transition probability matrix,

$$\mathcal{P}_{ss'} = \mathbb{P}\left[S_{t+1} = s' \mid S_t = s\right]$$

# Example: Student Markov Chain

### Example: Student Markov Chain Episodes

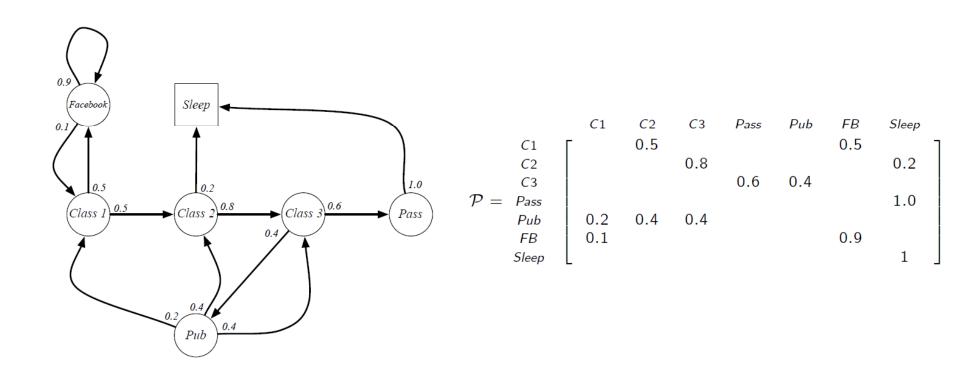

Sample episodes for Student Markov Chain starting from  $S_1 = C1$ 

$$S_1, S_2, ..., S_T$$

### Example: Student Markov Chain Transition Matrix

#### Markov Reward Process

A Markov reward process is a Markov chain with values.

#### **Definition**

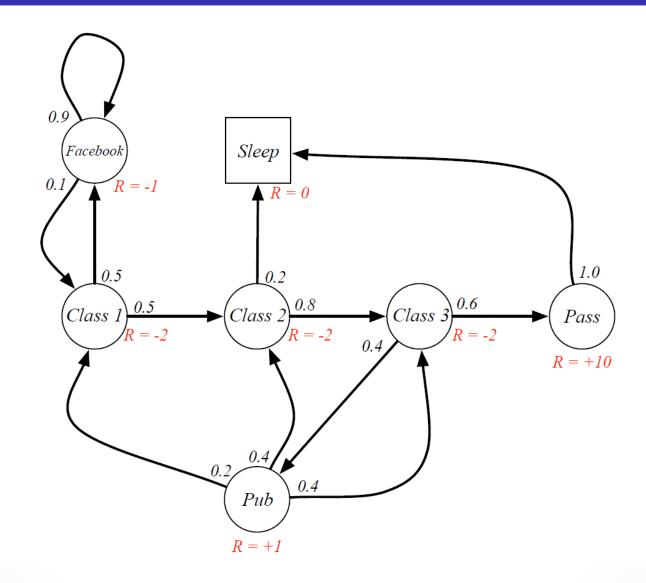

A Markov Reward Process is a tuple  $\langle \mathcal{S}, \mathcal{P}, \mathcal{R}, \gamma \rangle$ 

- $\blacksquare$  S is a finite set of states
- $\mathcal{P}$  is a state transition probability matrix,

$$\mathcal{P}_{ss'} = \mathbb{P}\left[S_{t+1} = s' \mid S_t = s\right]$$

- lacksquare R is a reward function,  $\mathcal{R}_s = \mathbb{E}\left[R_{t+1} \mid S_t = s\right]$
- lacksquare  $\gamma$  is a discount factor,  $\gamma \in [0,1]$

# Example: Student MRP

#### Return

#### **Definition**

The return  $G_t$  is the total discounted reward from time-step t.

$$G_t = R_{t+1} + \gamma R_{t+2} + \dots = \sum_{k=0}^{\infty} \gamma^k R_{t+k+1}$$

- The discount  $\gamma \in [0,1]$  is the present value of future rewards
- The value of receiving reward R after k+1 time-steps is  $\gamma^k R$ .
- This values immediate reward above delayed reward.
  - $lue{\gamma}$  close to 0 leads to "myopic" evaluation
  - $lue{\gamma}$  close to 1 leads to "far-sighted" evaluation

### Why discount?

Most Markov reward and decision processes are discounted. Why?

- Mathematically convenient to discount rewards
- Avoids infinite returns in cyclic Markov processes
- Uncertainty about the future may not be fully represented
- If the reward is financial, immediate rewards may earn more interest than delayed rewards
- Animal/human behaviour shows preference for immediate reward
- It is sometimes possible to use *undiscounted* Markov reward processes (i.e.  $\gamma = 1$ ), e.g. if all sequences terminate.

### Value Function

The value function v(s) gives the long-term value of state s

#### **Definition**

The state value function v(s) of an MRP is the expected return starting from state s

$$v(s) = \mathbb{E}\left[G_t \mid S_t = s\right]$$

### Example: Student MRP Returns

Sample returns for Student MRP: Starting from  $S_1 = C1$  with  $\gamma = \frac{1}{2}$ 

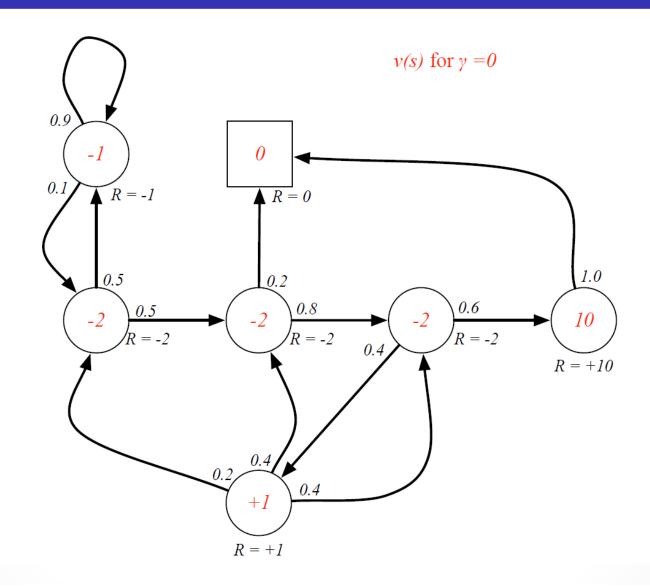

$$G_1 = R_2 + \gamma R_3 + \dots + \gamma^{T-2} R_T$$

C1 C2 C3 Pass Sleep

C1 C2 C3 Pass Sleep 
$$v_1 = -2 - 2 * \frac{1}{2} - 2 * \frac{1}{4} + 10 * \frac{1}{8} = -2.25$$
C1 FB FB C1 C2 Sleep 
$$v_1 = -2 - 1 * \frac{1}{2} - 1 * \frac{1}{4} - 2 * \frac{1}{8} - 2 * \frac{1}{16} = -3.125$$
C1 C2 C3 Pub C2 C3 Pass Sleep 
$$v_1 = -2 - 2 * \frac{1}{2} - 2 * \frac{1}{4} + 1 * \frac{1}{8} - 2 * \frac{1}{16} \dots = -3.41$$
C1 FB FB C1 C2 C3 Pub C1 ... 
$$v_1 = -2 - 1 * \frac{1}{2} - 1 * \frac{1}{4} - 2 * \frac{1}{8} - 2 * \frac{1}{16} \dots = -3.20$$

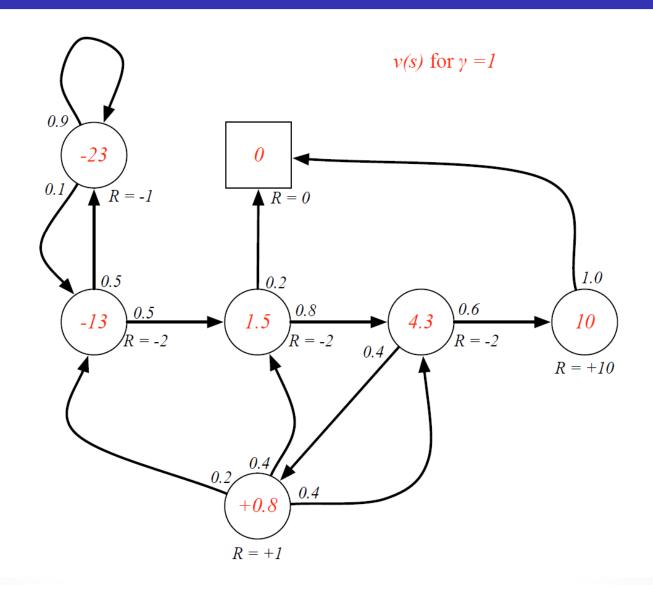

## Example: State-Value Function for Student MRP (1)

# Example: State-Value Function for Student MRP (2)

# Example: State-Value Function for Student MRP (3)

### Bellman Equation for MRPs

The value function can be decomposed into two parts:

- $\blacksquare$  immediate reward  $R_{t+1}$
- discounted value of successor state  $\gamma v(S_{t+1})$

$$v(s) = \mathbb{E} [G_t \mid S_t = s]$$

$$= \mathbb{E} [R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \dots \mid S_t = s]$$

$$= \mathbb{E} [R_{t+1} + \gamma (R_{t+2} + \gamma R_{t+3} + \dots) \mid S_t = s]$$

$$= \mathbb{E} [R_{t+1} + \gamma G_{t+1} \mid S_t = s]$$

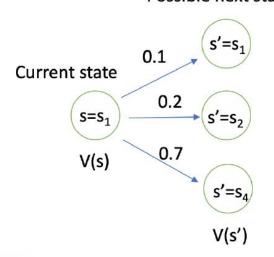

$$= \mathbb{E} [R_{t+1} + \gamma V(S_{t+1}) \mid S_t = s]$$

# Bellman Equation for MRPs (2)

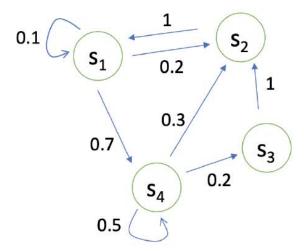

**Bellman equation** describes the iterative relations of states

$$V(s) = R(s) + \gamma \sum_{s' \in S} P(s'|s)V(s')$$

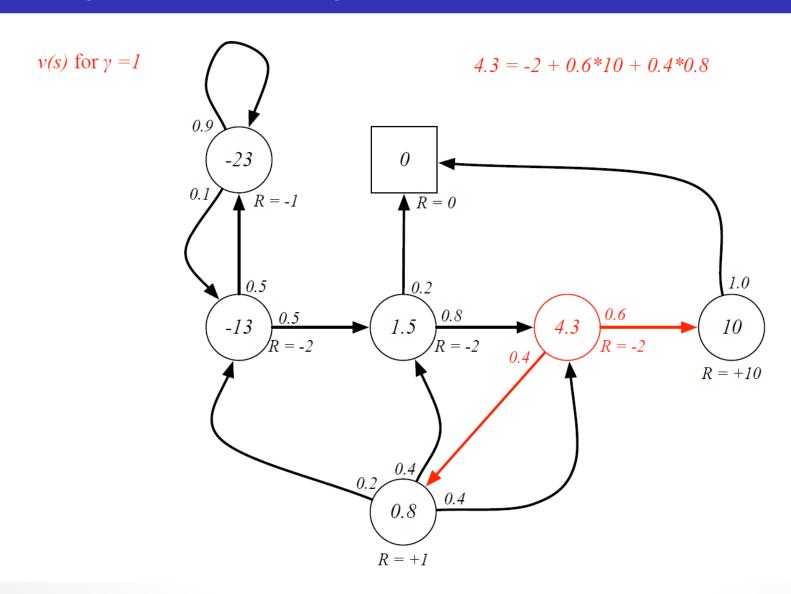

Possible next state

Markov Transition matrix

### Example: Bellman Equation for Student MRP

### Bellman Equation in Matrix Form

The Bellman equation can be expressed concisely using matrices,

$$\mathbf{v} = \mathcal{R} + \gamma \mathcal{P} \mathbf{v}$$

where v is a column vector with one entry per state

$$\begin{bmatrix} v(1) \\ \vdots \\ v(n) \end{bmatrix} = \begin{bmatrix} \mathcal{R}_1 \\ \vdots \\ \mathcal{R}_n \end{bmatrix} + \gamma \begin{bmatrix} \mathcal{P}_{11} & \dots & \mathcal{P}_{1n} \\ \vdots & & \\ \mathcal{P}_{11} & \dots & \mathcal{P}_{nn} \end{bmatrix} \begin{bmatrix} v(1) \\ \vdots \\ v(n) \end{bmatrix}$$

### Solving the Bellman Equation

- The Bellman equation is a linear equation
- It can be solved directly:

$$v = \mathcal{R} + \gamma \mathcal{P} v$$
$$(I - \gamma \mathcal{P}) v = \mathcal{R}$$
$$v = (I - \gamma \mathcal{P})^{-1} \mathcal{R}$$

- Computational complexity is  $O(n^3)$  for n states
- Direct solution only possible for small MRPs

### Solving the Bellman Equation

\_\_.

- There are many iterative methods for large MRPs, e.g.
  - Dynamic programming
  - Monte-Carlo evaluation
  - Temporal-Difference learning

#### Algorithm Iterative algorithm to calculate MRP value function

- 1: for all states  $s \in S, V'(s) \leftarrow 0, V(s) \leftarrow \infty$
- 2: while  $||V V'|| > \epsilon$  do
- 3:  $V \leftarrow V'$
- 4: For all states  $s \in S$ ,  $V'(s) = R(s) + \gamma \sum_{s' \in S} P(s'|s)V(s')$
- 5: end while
- 6: return V'(s) for all  $s \in S$
